PROFILE

Python Backend Developer with 3.4 years of experience at a fast-paced healthcare startup, contributing across four production healthcare products. Designed, developed, maintained, and optimized 150+ RESTful APIs using Django and Django REST Framework, backed by PostgreSQL and MySQL. Deployed backend services on AWS using Docker and CI/CD pipelines, implemented asynchronous processing with Celery and Redis, and integrated Razorpay, Twilio, AWS SageMaker, and OpenAI into production systems. Regularly contributed to backend architecture, cloud deployments, performance optimization, and mentoring junior developers.

SKILLS

Programming	Python, Object-Oriented Programming (OOP)
Libraries	NumPy, Pandas
Backend	Django, Django REST Framework (DRF), FastAPI, Flask, RESTful APIs, Scalable API Design, API Integration, Authentication & Authorization, JWT
Databases	PostgreSQL, MySQL
Cloud	AWS (EC2, S3, Lambda, CloudFront, MediaConvert, EventBridge)
DevOps	Docker, Git, GitHub, Bitbucket, Linux, CI/CD, Pytest
Async Processing	Celery, Redis
Tools & Integrations	Swagger/OpenAPI, Postman, Razorpay, Twilio, WeasyPrint
Core Concepts	REST API Design, Scalable Backend Architecture, Performance Optimization, Caching, API Security

WORK EXPERIENCE

Basava Pracheena Vaidya Anveshana Pvt Ltd	Bengaluru, India
Backend Developer	Jan 2023 – Apr 2026

Worked in a fast-paced healthcare startup, designing, building, and maintaining backend systems across four production healthcare products. Built and maintained 150+ RESTful APIs while contributing to backend architecture, cloud deployments, and performance optimization.

Stack: Python, Django, DRF, MySQL, PostgreSQL, Celery, Redis, Docker, AWS (EC2, S3, CloudFront, Lambda, MediaConvert, EventBridge), Git, Linux, Swagger/OpenAPI, Razorpay, Twilio

Nadiswara — Real-Time Pulse Analysis & Health Tracking (Jul 2023 – Dec 2024)

Real-time pulse-monitoring platform that streams device data and generates patient reports.

- Designed the backend architecture for real-time device streaming and automated report generation
- Built Celery + Redis processing pipelines that cut report generation time by **~40%**
- Built the Razorpay webhook integration for payments and automated OTP delivery through Twilio
- Generated diagnostic PDFs with WeasyPrint and optimized API queries, reducing latency by **30–35%**
- Containerized services on AWS EC2, improving deployment consistency and uptime
- Supported hardware R&D, validating sensor accuracy across **2,000+** patient sessions

BAA eLearn — Online Learning Platform (Jan 2025 – Apr 2026)

Course platform covering enrollments, progress tracking, and instructor analytics.

- Built core course, enrollment, and progress-tracking APIs along with instructor analytics
- Added asynchronous Razorpay payment verification, cutting payment failures by **~25%**
- Scaled background processing with Celery + Redis queues, raising task throughput by **~40%**
- Set up AWS MediaConvert, CloudFront, and Lambda for video delivery, cutting load times by **50%**
- Reviewed code from junior developers and kept module delivery on schedule

Carehub — Clinic & Patient Management System (Jul 2025 – Apr 2026)

Backend for consultations, patient history, and paid diagnosis workflows.

- Built consultation, history, and healer-management modules on PostgreSQL-backed APIs
- Integrated Razorpay and Twilio for payments and patient communication
- Added OpenAI vector search to improve patient record retrieval accuracy

- Deployed and monitored services on EC2/S3, contributed to CI/CD, and mentored junior developers

Tongue Analysis — Automated Diagnosis System (Jan 2023 – Jul 2023)

Diagnostic tool combining ML model output with a Django backend.

- Built Django/MySQL APIs to process tongue images and symptom data
- Integrated AWS SageMaker model outputs into the API layer
- Improved API response time by ~20% through query optimization
- Deployed on EC2/S3 and used Bitbucket and Postman for the testing workflow

Chimera Technologies Pvt. Ltd

Bengaluru, India

Software Engineering Trainee

Mar 2022 – Oct 2022

- Built a Java-based currency conversion microservice and a JavaScript weather app
- Gained hands-on experience in API testing, debugging, and frontend-backend integration

KEY HIGHLIGHTS

- Cut background report-processing time by ~40% by designing Celery + Redis pipelines for a real-time patient monitoring platform
- Collaborated with the hardware team to validate device sensor accuracy across 2,000+ real patient sessions, ensuring reliable integration between device data and backend services
- Rebuilt video delivery on AWS MediaConvert, CloudFront, and Lambda, cutting load times by 50%

EDUCATION

B.E., Information Science — Nagarjuna College of Engineering and Technology

2017 – 2021

74.3%
